

en

Cost is being driven down in remote asset management projects. Intelligent power management, and flashing over the air, enable high featured edge devices that operate independently for years rather than months. We design and supply products which enable human and machine communication and tracking over mobile data networks. We specialise in ultra light and ultra low power projects for remote asset management, automated metering, security and vehicle applications. We are familiar and experienced with GSM, GPRS, and EDGE, GPS, TCP-IP, and [Java](#). We consult on supply, marketing, product development and deployment.
